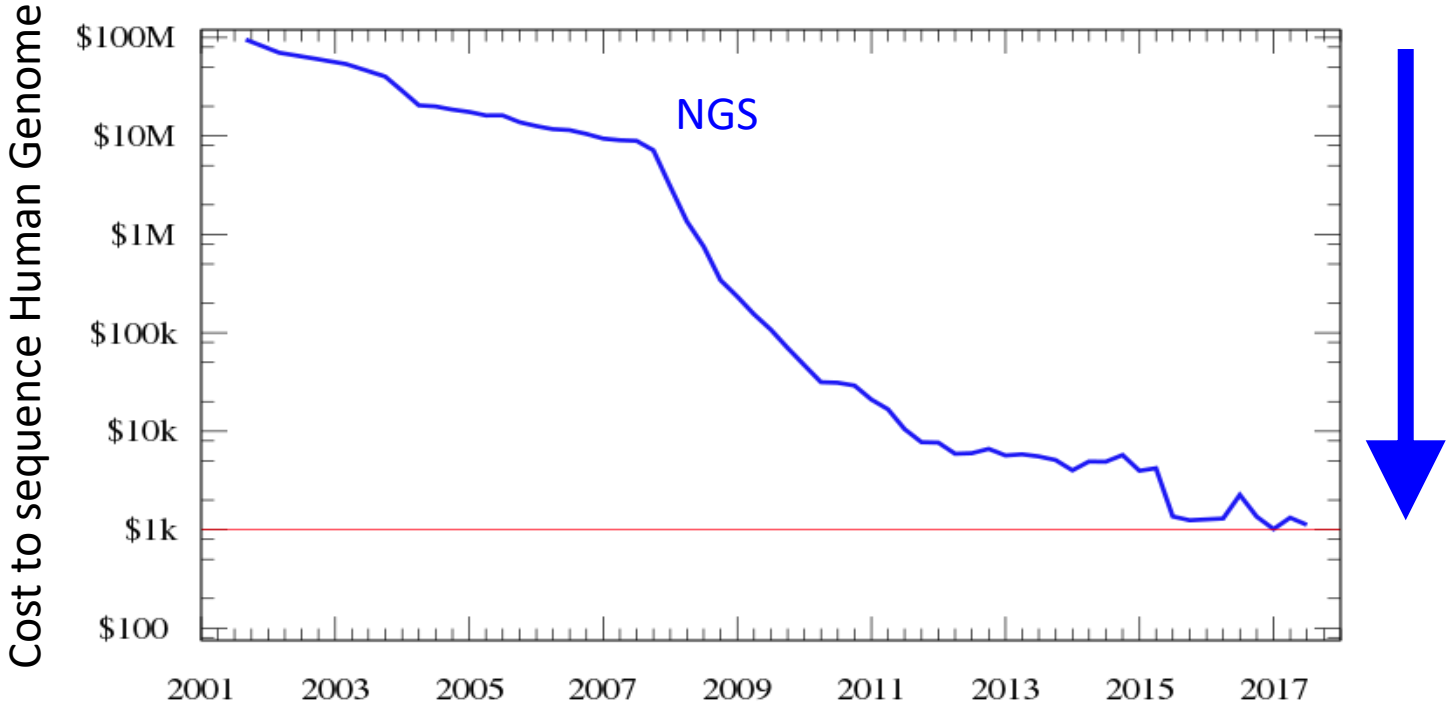
Next-Generation Sequencing (NGS)

Fundamentally different approach to sequencing that has made a revolution in genomic medicine

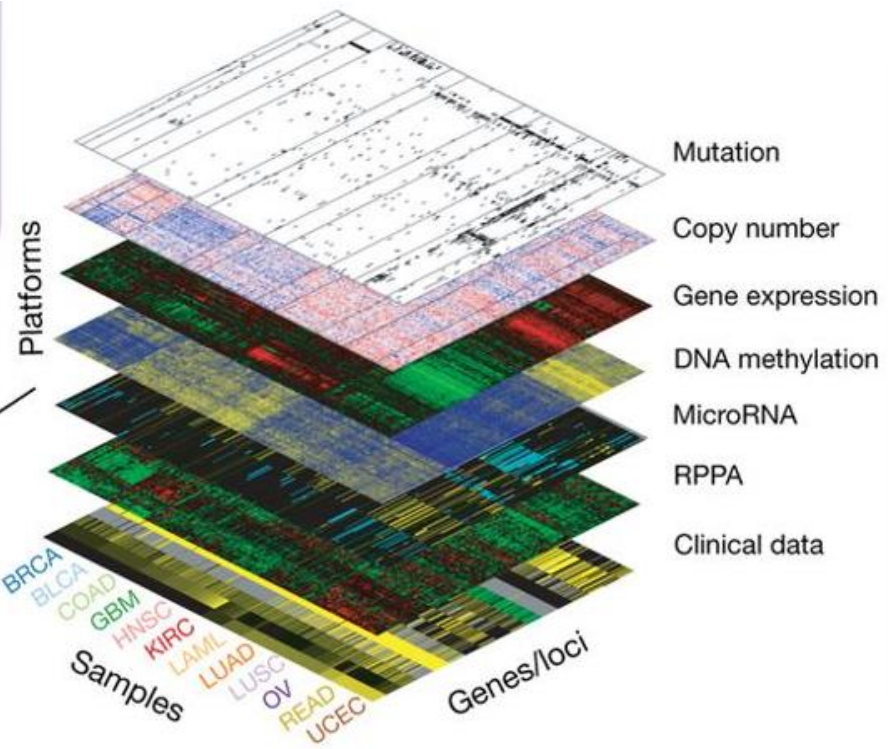
- 1 human genome
- 3000 million $
- 13 years work

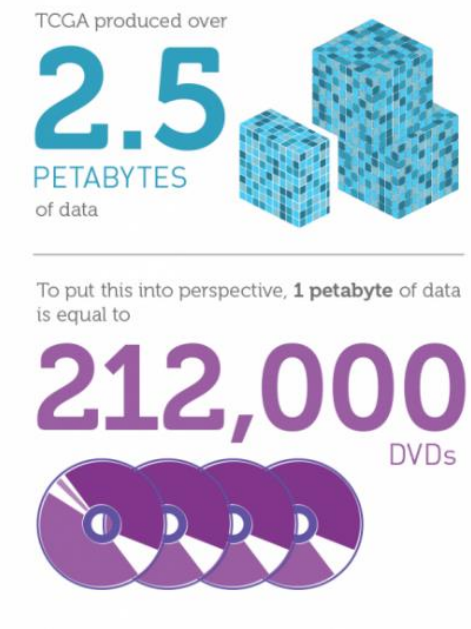


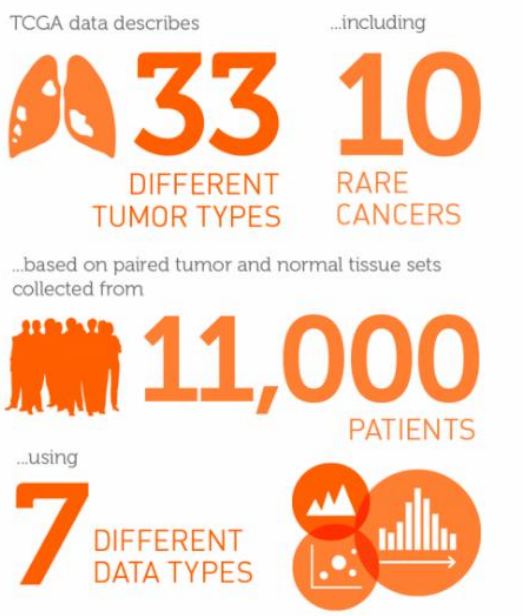
- 1 human genome
- 1000$
- 1 day work

Reference International **Research Projects** in cancer

The Cancer Genome Atlas 2005 - 2018







- Adrenocortical Carcinoma
- Adult ALL (B-cell and T-Cell)
- Anaplastic Thyroid
- Cholangiocarcinoma
- Chromophobe kidney
- High Risk MDS (del 5q- cases)
- Mesothelioma
- Pheochromocytoma
- Testicular Germ Cell
- Thymoma
- Uterine Carcinosarcoma
- Sarcomas

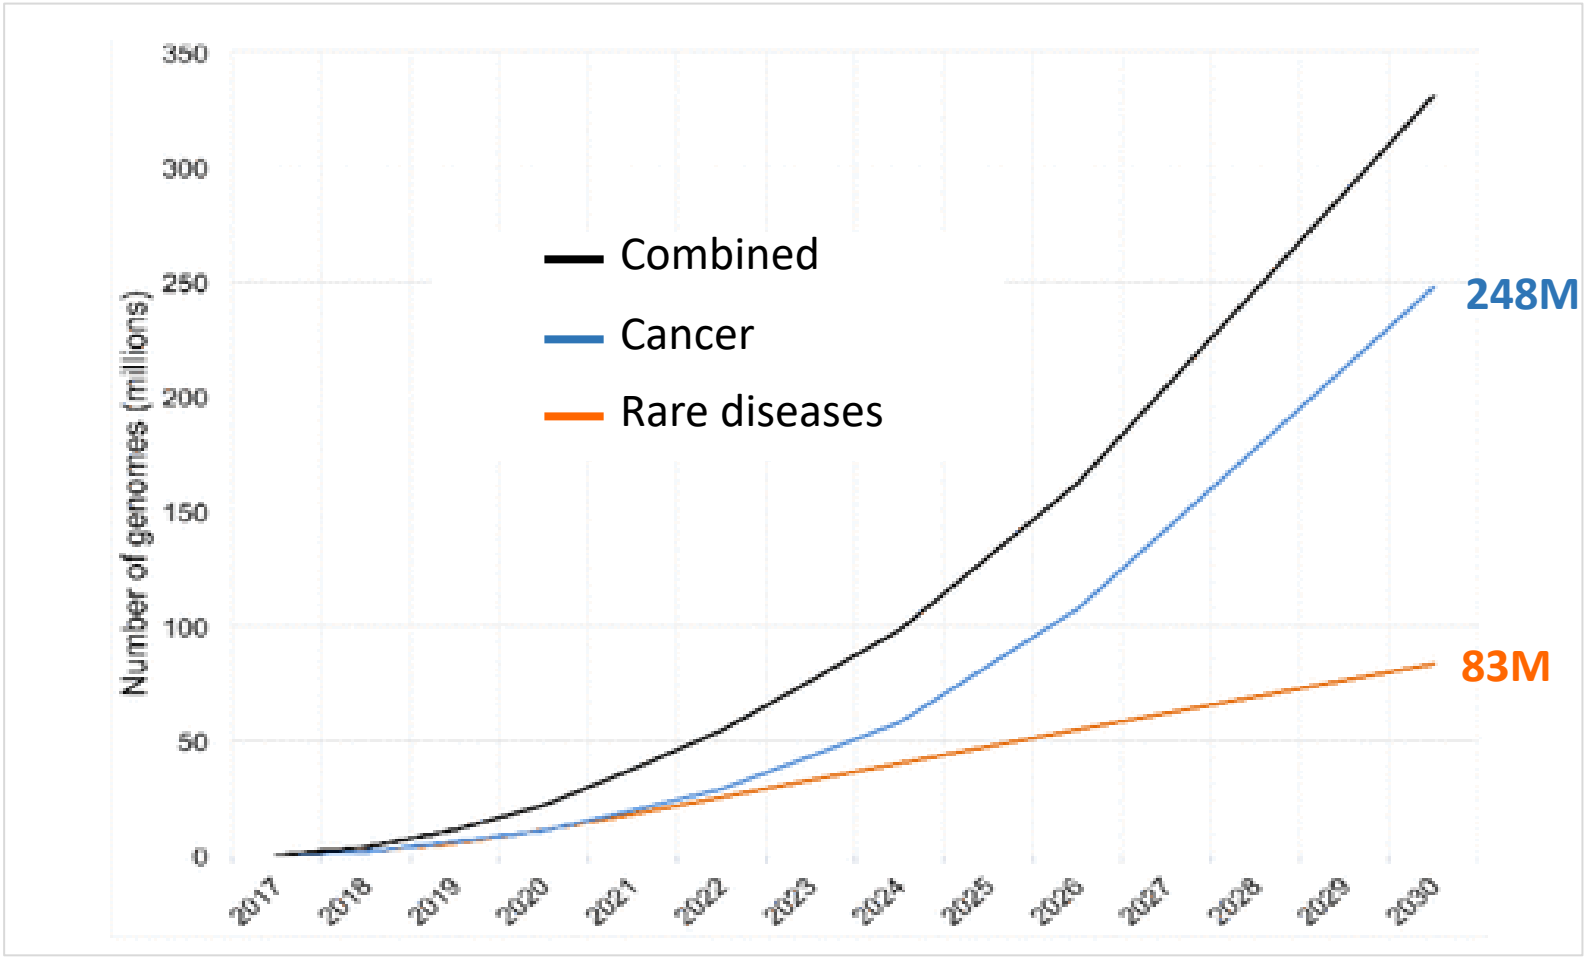
Application of WES & WGS in **Healthcare**

Exponential growth in genome sequences from rare diseases and cancer genomics



Genomics in healthcare: GA4GH looks to 2022. doi: https://doi.org/10.1101/203554

National Genomic Initiatives

The 100,000 Genomes Project

Sequence 100,000 genomes from NHS patients with rare disease or cancer.

The 100,000th sequence in December 2018.

Actionable findings for **1 in 4-5** rare disease patients, **50%** cancer cases contain the potential for a therapy or a clinical trial.

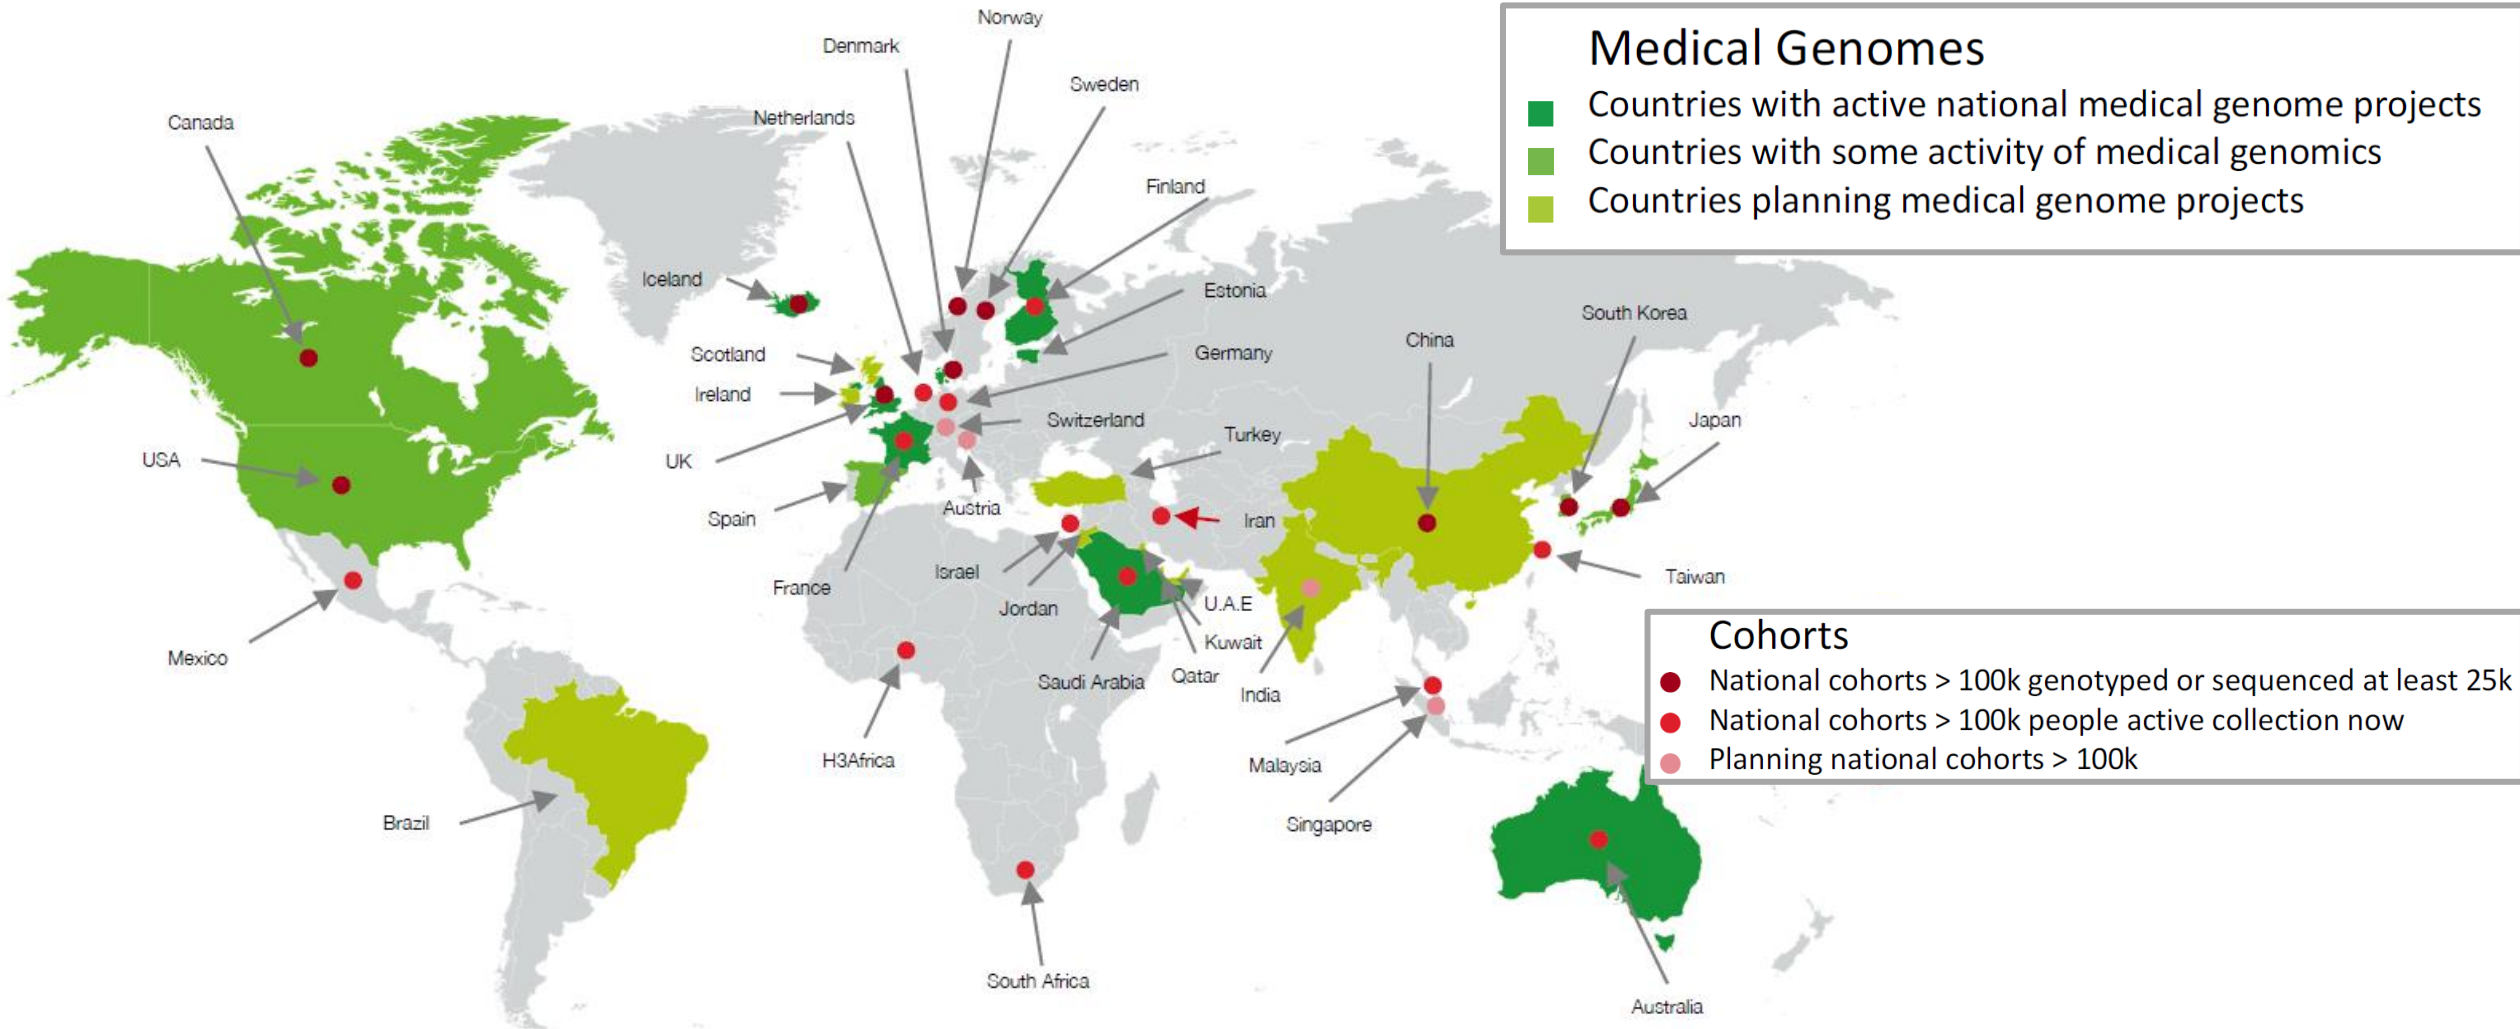
Precision Medicine Initiative

>1 million volunteers, provide genetic data, biological samples, information about their health.

Short-term goal: expand precision medicine in cancer research.

Long-term goal: bring precision medicine to all areas of health and healthcare

National **Medical Genome** Projects and Cohorts

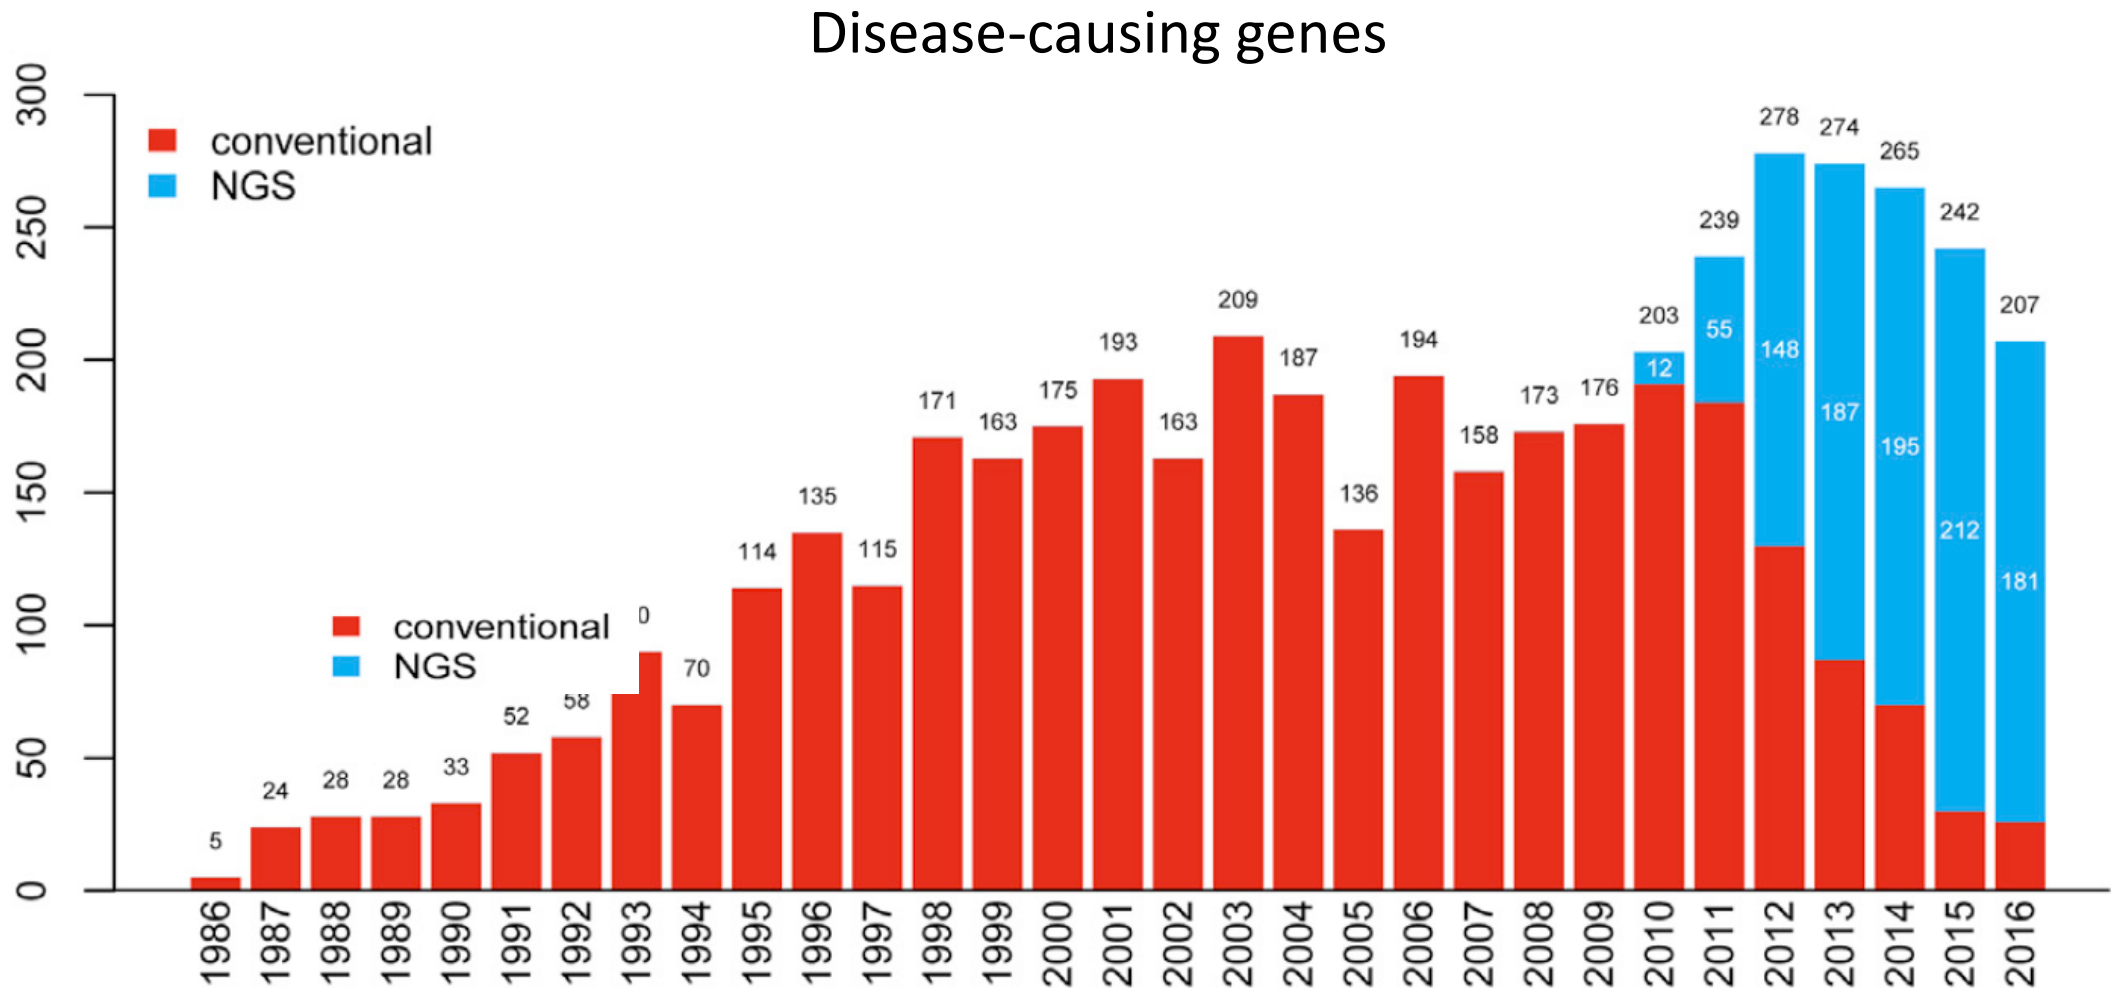


Data jointly gathered by EMBL-EBI and GA4GH (Sept 2018)

Global Alliance for Genomics & Health
Collaborate. Innovate. Accelerate.

EMBL-EBI

NGS for identification **genetic markers for healthcare**



AJHG 2017;100:695

Human Genome

- 3.200 millions of base pairs
- 20.000 genes (1-2% of genome)
- >200.000 coding exons

- >**4 M** single nucleotide variants per individual
- >**20.000** structural variants per individual
- **10-20 "loss-of-function"** variants in healthy individual (no phenotype)

Conclusions

- Large genomic national projects exist (cancer and rare diseases), with exponentialy increase of WGS/WES in medicine.

- Technical approaches suitable for different sample types exist (e.g. FFPE, plasma) and additional resources are evolving (e.g. long reads). However, challenges still exist (e.g. in homogeneity of coverage, bioinformatic analysis, variant interpretation, incidental findings…)

- Next Generation Sequencing is an enormous force transforming conventional medicine into a more efficient and safer personalized medicine
